

WordPress Modal using GenerateBlocks

 vjdesign.com.au/wordpress-modal-generateblocks/

Build an amazing WordPress modal popup using GenerateBlocks Container and Button blocks. The modal be easy to edit, responsive, accessible and visually appealing. You can set one up in just 5 mins!

GeneratePress theme (and GenerateBlocks) does not come with a pop modal by default. The theme author believes that not everyone would use it and it adds a decent amount of CSS. I agree! Most modal plugins add a lot of code and may end up slowing your website. I also realise that most popups are poorly designed and not fully accessible.

We are using the default `<dialog>` HTML element to generate this modal pop up. It works in all modern browsers.

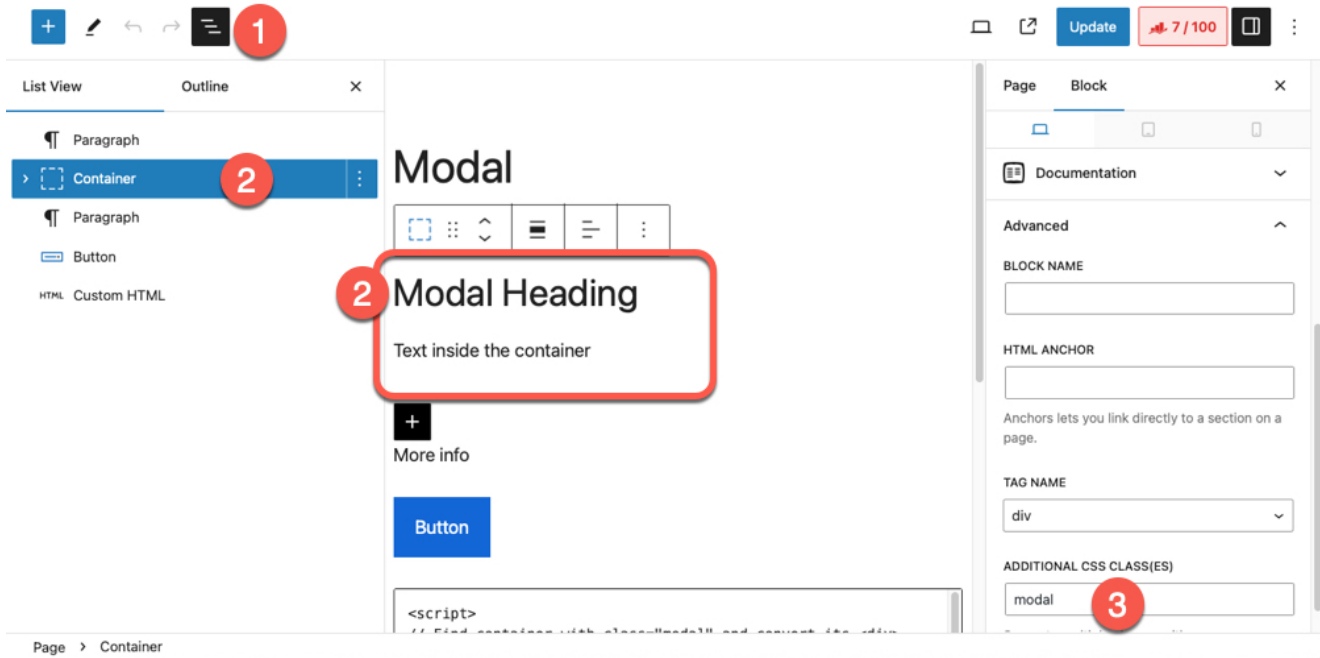

To create a model that you can open and close by just clicking a button, we will use GenerateBlocks and a little bit of CSS and some JavaScript. Refer to the video above and instructions below.

Add a popup modal to a page, post or GeneratePress Element (to display site wide).

1. Create Modal Container Block

Add a GenerateBlocks Container block and style it as required. Add required content within.

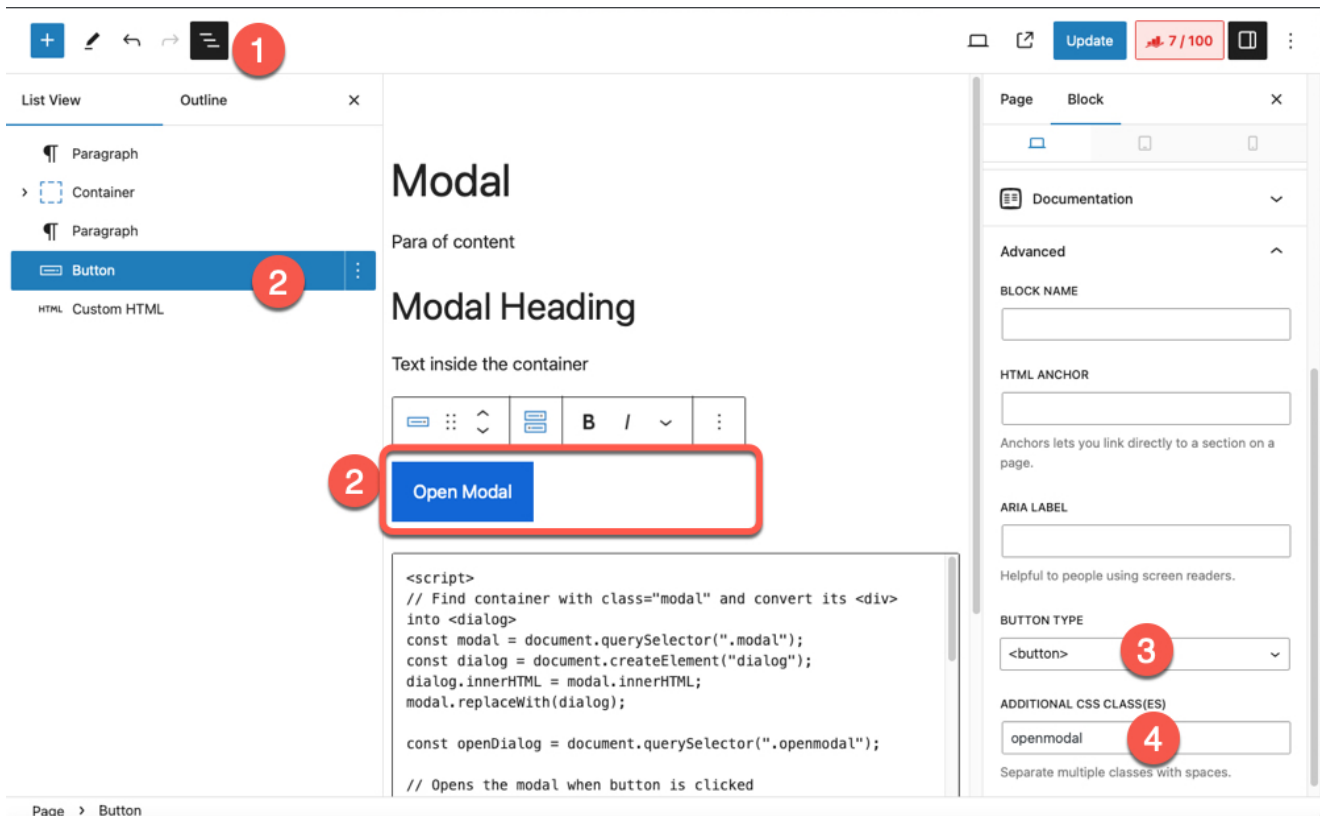

Click on Document Overview (1), select the Container Block (2) and from Advanced section, add a `modal` class (3).

2. Create the Open Modal button

Add a button and style it as required.

Click on Document Overview (1), select the Button Block (2) and from Advanced section, change the type to `<button>` (3) and add a `openmodal` class (4).

3. Add the JavaScript Code to show/hide the modal

Add a Custom HTML block (2) and add the JavaScript and CSS code required to create the show/hide pop up.

The screenshot shows a web editor interface. At the top, there is a toolbar with a plus sign, an eraser, undo, redo, and a menu icon. A red circle with the number '1' is placed over the menu icon. Below the toolbar, there are two tabs: 'List View' and 'Outline'. The 'List View' tab is active, showing a list of components: Paragraph, Container, Paragraph, Button, and Custom HTML. A red circle with the number '2' is placed over the 'Custom HTML' block. To the right of the component list, there is a preview area showing a modal dialog. A red circle with the number '3' is placed over the JavaScript code in the Custom HTML block. The code is as follows:

```
<script>  
// Find container with class="modal" and convert its <div>  
into <dialog>  
const modal = document.querySelector(".modal");  
const dialog = document.createElement("dialog");  
dialog.innerHTML = modal.innerHTML;  
modal.replaceWith(dialog);  
  
const openDialog = document.querySelector(".openmodal");  
  
// Opens the modal when button is clicked  
openDialog.addEventListener("click", e => {
```

Copy-paste the script and styles below into the Custom HTML block.

```

<script>
// Find container with class="modal" and convert its <div> into <dialog>
const modal = document.querySelector(".modal");
const dialog = document.createElement("dialog");
dialog.innerHTML = modal.innerHTML;
modal.replaceWith(dialog);

const openDialog = document.querySelector(".openmodal");

// Opens the modal when button is clicked
openDialog.addEventListener("click", e => {
  dialog.showModal()
})

// Close the modal when clicked outside modal
dialog.addEventListener("click", e => {
  const dialogDimensions = dialog.getBoundingClientRect()
  if (
    e.clientX < dialogDimensions.left ||
    e.clientX > dialogDimensions.right ||
    e.clientY < dialogDimensions.top ||
    e.clientY > dialogDimensions.bottom
  ) {
    dialog.close();
  } else {
  }
})
</script>
<style>
dialog::backdrop {
  background-color: rgba(243,74,83,0.5);
}
</style>

```

Is this modal accessible? performant?

We are using the default `<dialog>` HTML element to generate this modal pop up. It works in all modern browsers. My code converse the `<div>` element in the Container block into `<dialog>` block. If the JavaScript fails to load, the contents would still display.
